Empathize & Discover — Empathy Map Canvas

Date:	03 October 2026
Team ID:	SWTID-2026-3636
Project Name:	Implement Client Script & UI Policy (Incident Table)
Maximum Marks:	4 Marks

1. Project Context & Target User Persona

Project Description: This project focuses on implementing Client Scripts and UI Policies on the Incident table in ServiceNow/ITSM platform. The primary objective is to dynamically control form field behaviors (making fields mandatory, read-only, or visible) based on conditional triggers (e.g., ticket state, priority, category). This streamlines data entry, eliminates manual mistakes, and enforces consistent ITSM compliance.

Target User Persona: IT Service Desk Analyst / Support Technician & Incident Manager. They interact with the Incident form daily to create, triage, update, and resolve service requests and technical incidents.

2. Empathy Map Canvas

THINK & FEEL • 'Why do I have to search through 30+ fields when I just need to log a quick incident?' • 'I feel frustrated when I try to resolve a ticket and get rejected because I forgot a mandatory field.' • 'I want form interactions to be smooth, fast, and guiding, so I don't miss critical data.' • 'Aspirations: Achieve faster resolution times (MTTR) and maintain clean incident record data.'	HEAR • Service Desk Lead: 'Make sure all incident categorization and resolution notes are completed properly.' • Incident Manager: 'We have reporting errors because techs leave key fields blank.' • Users/Clients: 'Why is my ticket status taking so long to update correctly?' • Peers: 'Is there a trick to knowing which fields are mandatory during ticket resolution?'
SEE • Cluttered incident form with unnecessary fields visible all at once. • Error messages popping up late after trying to save incomplete tickets. • Inconsistent data entry across team members due to lack of dynamic form rules.	SAY & DO • 'Let me fill out this ticket as quickly as possible so I can handle the next incoming call.' • Enters filler/placeholder text when forced to fill fields that aren't relevant to the situation. • Manually checks if all required fields are filled before submitting.

- Long scrollbars and confusing multi-tab field layouts.

- Expresses desire for the form to 'smartly adapt' to what state the ticket is currently in.

PAIN (Fears, Frustrations, Obstacles)

- Frustration with human error and forgotten fields causing ticket rework.
- Time lost scrolling through irrelevant fields.
- Risk of non-compliance with ITSM process guidelines.
- Cognitive fatigue from complex static forms during high-volume call shifts.

GAIN (Wants, Needs, Measures of Success)

- Dynamic UI: Fields automatically become visible/mandatory only when relevant.
- Real-time client-side validation reducing submission errors.
- Higher data accuracy, improved SLA reporting, and reduced average handling time.
- Seamless, guided user experience for support staff.

3. Application of Empathy Map Insights to UI Policy & Client Script Implementation

1. Dynamic Visibility (Solving Clutter & Cognitive Overload)

- Trigger: When State changes to 'Resolved' or 'Closed'.
- Action: Automatically show 'Resolution Code' and 'Resolution Notes'. Keep them hidden during initial ticket logging to reduce visual noise.

2. Dynamic Mandatory Enforcement (Eliminating Data Entry Errors)

- Trigger: When Incident Priority is '1 - Critical' or State is 'Resolved'.
- Action: Make 'Work Notes' and 'Assignment Group' mandatory dynamically on the client side before submission.

3. Read-Only Control (Data Governance & Integrity)

- Trigger: Once State is 'Closed'.
- Action: Make all core fields read-only to prevent accidental modification after ticket lifecycle closure.

4. Client Script Enhancements (Real-Time Responsiveness)

- Trigger: onChange of Impact/Urgency or Category.
- Action: Dynamically calculate priority or populate relevant subcategories instantly without requiring page reloads.
