

Project Design Phase-II

Data Flow Diagram & User Stories

Date:	03 October 2026
Team ID:	SWTID-2026-3636
Project Name:	Implement Client Script & UI Policy (Incident Table)
Maximum Marks:	4 Marks

1. Data Flow Diagrams (DFD)

A Data Flow Diagram (DFD) visually represents the flow of information within the Incident Management System. It depicts how support analysts interact with the Incident form, how Client Scripts and UI Policies process real-time events on the client side, and how validated data is written to the platform database.

Level-0 Context DFD Flow:

- External Entities: IT Support Analyst (User), Incident Manager, System Admin.
- Central Process: [1.0 Incident Management & Form Control Engine].
- Data Inflow: Incident details, priority changes, state updates, resolution inputs.
- Data Outflow: Dynamic UI field visibility/mandatory states, real-time client validation warnings, saved incident record confirmation.

Level-1 Detailed Process Flow:

- **1.1 Triage & Form Initialization:** Support Analyst opens Incident form -> onLoad Client Script triggers -> checks user roles and sets initial field layouts.
- **1.2 Dynamic Field Event Handling:** User changes State or Priority -> onChange Client Script / UI Policy triggers -> dynamically sets fields to Visible, Mandatory, or Read-Only.
- **1.3 Real-time Client Validation:** User fills mandatory fields -> onSubmit Client Script verifies inputs (e.g., resolution code present when state=Resolved).
- **1.4 Data Persistence & Data Store:** Validated payload sent via REST API -> Saved in Data Store [D1: Incident Records Table] and audit logs.

2. User Stories & Acceptance Criteria

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
-----------	-------------------------------	-------------------	-------------------	---------------------	----------	---------

Service Desk Analyst	Dynamic Field Visibility	USN-1	As a Service Desk Analyst, I want the 'Resolution Code' and 'Resolution Notes' fields to appear only when the ticket state is set to 'Resolved', so that the form remains uncluttered during initial logging.	Resolution fields remain hidden when State is New/In Progress and dynamically appear when State = Resolved.	High	Sprint-1
Service Desk Analyst	Mandatory Field Rules	USN-2	As a Service Desk Analyst, I want the system to require 'Work Notes' and 'Assignment Group' whenever an Incident is Priority 1 (Critical), so that critical incidents always have complete escalation details.	Form submission is blocked if Priority = 1 and Work Notes/Assignment Group are empty.	High	Sprint-1
Service Desk Analyst	Client-Side Priority Calculation	USN-3	As a Service Desk Analyst, I want the Priority field to recalculate automatically when I change Impact or Urgency, so that I don't have to manually look up priority matrix values.	Priority dropdown updates instantly on the client side upon changing Impact or Urgency.	Medium	Sprint-1
Incident Manager	Data Governance & Read-Only	USN-4	As an Incident Manager, I want closed incident records to automatically become Read-Only for non-admin users, so that closed historical data cannot be accidentally altered.	All form fields become locked/read-only once State = Closed.	High	Sprint-1
Service Desk Analyst	Category Guidance Prompts	USN-5	As a Service Desk Analyst, I want to see dynamic diagnostic guidance when selecting 'Hardware' or 'Network' categories, so that I follow standardized troubleshooting procedures.	Warning/guidance prompt pops up upon selecting Hardware or Network category.	Medium	Sprint-2
System Administrator	UI Policy Maintenance	USN-6	As a System Admin, I want UI policies configured declaratively without complex scripts, so that future field behavior changes can be maintained easily.	UI policies execute via condition builder without hardcoded server scripts.	Low	Sprint-2
