

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date:	03 October 2026
Team ID:	SWTID-2026-3636
Project Name:	Implement Client Script & UI Policy (Incident Table)
Maximum Marks:	4 Marks

Functional Requirements

Following are the functional requirements of the proposed solution for the Incident Table UI Policy & Client Script implementation:

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Dynamic UI Field Visibility Policy	• Trigger UI Policy when Incident State changes to 'Resolved'. • Automatically reveal 'Resolution Code' and 'Resolution Notes' fields. • Hide resolution fields when Incident State is 'New' or 'In Progress' to reduce clutter.
FR-2	Dynamic Mandatory Field Enforcement	• Require 'Resolution Code' and 'Resolution Notes' dynamically when State = Resolved. • Require 'Work Notes' and 'Assignment Group' dynamically when Incident Priority is '1 - Critical' or '2 - High'. • Block form submission if mandatory conditions are not met.
FR-3	Form State & Read-Only Governance	• Trigger UI Policy when Incident State changes to 'Closed'. • Automatically lock all form fields to Read-Only to preserve historical record integrity. • Prevent unauthorized post-closure modifications by non-admin users.
FR-4	Real-Time Client Script Validation & Automation	• onChange Client Script: Recalculate Priority dynamically when Impact or Urgency dropdown changes. • onChange Client Script: Display warning prompts and required diagnostic checks when Category is set to 'Hardware' or 'Network'. • onSubmit Client Script: Validate caller and assignment details before saving record.

Non-functional Requirements

Following are the non-functional requirements of the proposed solution:

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	The UI Policy and Client Script layout must provide an intuitive user interface that reduces form clutter, highlights mandatory fields in real time, and requires minimal training for Service Desk Analysts.
NFR-2	Security	Enforce Role-Based Access Control (RBAC) ensuring only authorized ITIL users can modify field states, while locking Closed incidents to Read-Only to guarantee audit compliance and data integrity.
NFR-3	Reliability	Client Scripts and UI Policies must execute reliably across all major web browsers (Chrome, Edge, Firefox, Safari) without throwing JavaScript errors or breaking form state execution.
NFR-4	Performance	Client-side evaluations must execute instantaneously (< 200 ms) upon state changes or field updates without causing browser lag or unneeded server roundtrips.
NFR-5	Availability	The dynamic UI scripts must be highly available as part of the primary ServiceNow cloud platform instance, offering 99.99% operational uptime.
NFR-6	Scalability	The client-side logic must seamlessly handle thousands of concurrent support analyst sessions without degrading browser performance or instance response times.
